

# Preparse 0.1.3

Preparse is a preprocessing language written in python for python. It's easy too! Here's an example:

```
#use std
#define myvar myvalue
#echo myvar
```

This will print "myvalue" to the screen when you run in python:

```
import preparse
import preparse.compiler as comp
comp.compile_single("myfile.txt")
preparse.run("myfile.ppak")
```

## Installation:

To install, make sure you have git and pip installed and then run:

```
pip install git+https://github.com/Krobix/preparse
```

Docs can be found at <https://krobix.github.io/preparse/docs/>
